Case of the Month

October 2011

Before

After

This 37 year old female was referred for endodontic treatment of a painful tooth #4. Examination revealed recurrent caries into the pulp resulting in pulpal necrosis and acute symptoms. Radiographic analysis demonstrated apical "S" shaped curvature of the root.

Careful negotiation with nickel-titanium instruments allowed for complete instrumentation to the apical terminus without transporting the canal system. Such technique combined with adequate gutta-percha sealing is important in maximizing successful prognosis.

Creating happy patients with experience & skill
